Project: AI Visibility Website

Build and launch the website for our new AI Visibility company.

The website should be built in **Vite** and designed from the ground up to perform well across **SEO, GEO/AEO, performance and security**.

The initial project should include:

- Build and launch the website based on the provided design/content.
- Clean, modular Vite codebase that makes it easy to add and modify pages.
- Proper technical SEO foundation: site structure, semantic HTML, metadata, canonical URLs, sitemap, robots.txt and structured data/schema.
- GEO/AEO readiness, ensuring content and pages are accessible, crawlable and structured for both search engines and AI systems.
- Strong performance and Core Web Vitals.
- Responsive implementation across desktop and mobile.
- Contact/lead forms, including validation and spam/bot protection.
- Analytics and Google Search Console setup.
- Domain, DNS, SSL, CDN and relevant security configuration.

Development & Publishing Setup

As part of building the website, set up a simple workflow that allows me to continue working on it independently with **Claude**:

Claude → GitHub repository → deployment → production

The code should be structured and documented so I can use Claude to create new pages, modify existing ones, push changes to the repository and publish them without requiring ongoing developer support.

The website itself will also serve as the first environment where I can experiment with adding and optimizing pages for SEO/GEO over time.
